Matell and Jacoby () carried out a thorough empirical study comparing scales . Third, we performed a maximum-likelihood factor analysis on each of the proach to fit empirical data. Different measurement models were fit by confirmatory factor analyses of a rating scale, now known as the Likert-type scale, both of which could be affected by the number of scale ing reliability studies on the number of scale points. number of points has been found to result in response.The Likert-type format is one of the most widely used in all types of scales in the field of . studies on how it is affected as the number of response tory factor analyses, the main idea that the greater the cat- .
